Class: LY B.Tech IT | Div: A | Batch: A3

Faculty In-charge:
Prof. Poonam Narkhede/ Dr. Ankita Nagmothe

1. INTRODUCTION

- PocketQubes are 5 cm educational satellites. After release, SomaiyaSat has one radio, under 1 W average power, and only a few minutes in view of a ground station.
- Four modes share that radio: TT&C housekeeping, Codec2 voice, M17 voice and data, and SSTV images. Each second, the link can carry only one of them.
- Students, faculty, collaborator ReOrbit (Finland), and the global amateur-radio community are not in one room. A public site is how the mission reaches them.
- The motivation is use case KJS-SRS-01. somaiyasat.vercel.app is that owned channel, and the routing line is computed live, not played as an animation.

2. PROBLEM STATEMENT

- A student space mission is easy to file as a report and hard to understand in a minute. Without a journey, a visitor never sees why manual scheduling fails inside a short pass.
- The offer is split across a technical document. There is no single path from the constraint — power, bandwidth, a few minutes of visibility — to a proof the visitor can watch.
- Scope is the public website only: Home, Mission, Architecture, Program, and Ground Station. No paid ads. The simulation is compressed, and it is not a live spacecraft feed.

3. OBJECTIVES

- Position SomaiyaSat and SomaiyaPod with one offer: a PocketQube that deploys itself, decides what to send home, and serves amateur radio.
- Move a visitor from awareness to action. The primary call to action is Open ground station. The secondary path is Read the mission.
- Make the technical proof marketable. Every routing choice is scored and explained, so the demonstration is also the trust message.
- Stay tied to the product already deployed: the same five pages, and the same live stream the ground station uses.

4. LITERATURE REVIEW

- Strategy: inbound content marketing, planned with the RACE journey — Reach, Act, Convert, Engage.
- Chaffey and Ellis-Chadwick (2019) — owned media and a planned journey outperform one-off promotion when the goal is understanding, not a single sale.
- Pulizzi (2014) and Hollebeek and Macky (2019) — content earns trust when it answers the audience's question. Engagement follows usefulness.
- Kotler, Kartajaya and Setiawan (2017) — Marketing 4.0 treats aware-to-advocate as one connected path. Isolated pages do not make a journey.
- Gap: student satellite work usually stops at a report. It rarely offers a public path that explains the constraint and lets a visitor watch the scheduler decide.

5. METHODOLOGY / SYSTEM DESIGN

6. IMPLEMENTATION DETAILS

- Page design. Dark mission-control pages, short headlines, and one amber button. The navigation bar never leaves, so no page is a dead end. Architecture draws SomaiyaPod, SomaiyaSat, and the ground segment on one diagram.
- Marketing strategy. Pull marketing through owned content, not paid reach. The audiences named on the site are students and faculty, ReOrbit, and the amateur-radio community as the beneficiary.
- Tied to the product. Each queued item is scored 0.40 priority + 0.25 urgency + 0.25 link + 0.10 power. A mode below its SNR floor is dropped before scoring.
- Guard rails run first: no usable link, a 25 s operator override, safe mode under 25% charge, and a watchdog if housekeeping is missed. The ground station prints the reason.

7. RESULTS & DISCUSSION

8. KEY FINDINGS

- One primary button and a persistent navigation bar are enough to join the five pages. Extra menus would compete with the demonstration.
- The live stream is the engagement asset. A decision is computed every simulated second, so the link floor, safe mode, and policy are visible.
- Explainable scores turn a power and bandwidth limit into a trust message for faculty and for the amateur-radio audience.
- Both paths can share one site: open the ground station at once, or read the mission, architecture, and program first.

9. CONCLUSION

- The deployed site markets KJS-SRS-01 as a public, explainable mission rather than a private lab note.
- A visitor can take the offer in one click, or walk the longer story: problem, architecture, program, then proof.
- Students, faculty, and the HAM community can see the constraint — minutes of visibility, four modes, sub-1 W — and the guarded router, without a briefing.

10. FUTURE SCOPE

- Measure the journey: page views, call-to-action clicks, and time on the ground station.
- Extend reach with Somaiya social channels, a QR code on print material, and a one-page brief for amateur-radio clubs.
- Still open: no paid reach yet, the pass is time-compressed, and this is a demonstration, not a spacecraft feed.
